adjustment clauses (FAC) and the last rate case.

purchased gas adjustments (PGAs), adjust rates in response to changes in the price of fuels used by generating facilities and Certain cost trackers approved over the last couple of years allow for rate adjustments when the cost for a particular business Virtually all fuel and purchased function, for whatever reason, gas cost trackers are symmetrical changes. A tracker for bad debt, for example, does not distinguish between an increase because of a greater number of nonpaying customers or higher debt per customer.

III. Principles for Cost Recovery

A. "Reasonable opportunity" criterion

State commissions have applied myriad criteria for utility cost recovery. Regulators are legally bound to allow utilities the opportunity to recover prudently incurred costs. Prudent costs reflect utility management that makes rational and well-informed decisions. The word Under this zero-based approach, "opportunity" can refer to the utility having a good chance of earning its authorized rate of return and is distinct from an entitlement."Earning the authorized rate of return" means prudent variable costs (e.g., recovery procedure can occur for perations and maintenance) and earns a return of and on prudently incurred fixed costs, including its Some cost trackers, such as fuelcost of capital as determined in

B. Incentive effects of cost trackers

Commissions traditionally allow cost recovery only after a rate case review. Other alternatives such as a cost trackerwait to recover those costs, the would require that a utility shower its earnings are in the violation of the "opportunity" condition for particular cost items. A violation can occur when minimize additional costs. a certain cost is substantial, unpredictable, and generally beyond a utility's control. Other than costs relating to fuel and purchased power and gas, few other costs fall within the confines of "special circumstances." Parties to regulatory proceedings naturally disagree over when these circumstances exist. To clarify their positions to utilities, intervening groups, and the general public, commissions should consider issuing policy statements articulating standards for the recovery of costs through trackers.

egulators, until recently, have taken a cautious approach to trackers, partially because they weaken the incentive of a utility to control its costs. Controlling utility costs is a primary objective of regulators because it contributes to lower rates and reflects efficient utility management. Cost trackers can, in various ways, result in higher utility costs. First, they undercut the positive effects of regulatory lag on a utility's costs.

"Regulatory lag" refers to the undergoes a change in cost or can reflect these changes in new through (with little or no that the longer the regulatory lagto customers with minimal the more incentive a utility has toconsequences for sales. Cost control its costs; when a utility interim. The utility, consequently cost containment. The difficult would have an incentive to

lag as an important tool for

motivating utilities to act efficiently. As economist and regulator Alfred Kahn once remarked:

Freezing rates for the period of the lag imposes penalties for inefficiency, excessive conservatism, and wrong guesses, and offers rewards for their opposites; companies can for a time keep the higher profits they reap from a superior performance and have to suffer the losses from a poor one.

a general rule, would exert minimal effort in controlling costs and investment decisions. time gap between when a utility if it has no effect on the utility's A utility recovering fuel profits.¹² This condition occurs sales levels and when the utility when a utility is able to pass

rates. Economic theory predicts regulatory scrutiny) higher costs containment constitutes a real incurs costs, the longer it has to cost to management. Without any expected benefits, management would exert minimum effort on problem for the regulator is to detect when management is lax. Commissions rely on regulatory Regulators should concern themselves with this problem; lax management translates into a higher cost of service and, if undetected, higher rates to the utility's customers. Regulators expected benefits, should closely monitor and scrutinize costs, such as those subject to cost trackers, that utilities have little incentive to control.

When mechanisms for cost recovery differ across functional areas, perverse incentives can arise that would make it profitable for the utility not to pursue cost-minimizing activities. The result is higher rates to utility customers. A utility with a FAC might postpone maintenance of a power plant even when it would cost less than the savings in fuel costs. The utility could not immediately (or even at any time) recover additional maintenance costs, while it could pass the higher fuel costs through the FAC.

Rational utility management, as Cost trackers, in the long run, can bias a utility's technological costs through a FAC, for example, might want to adopt

fuel-intensive generation expensive from a life-cycle perspective. The result, again, is comprehensive trackers that higher rates to utility customers.recover a wide array of costs

🕇 ost trackers also could motivate utilities to shift more of their costs to functions subject to trackers. They might, for example, want to classify routine maintenance costs as a capital expense that receives tracker cost recovery. Such shiftssimultaneously. could lead to earning an excessive rate of return. Regulators implementing trackers should carefully define applicable costs They should also examine costs claimed under trackers to ensure cost recovery that the utility recovers only appropriate costs through the tracker.6

An important incentive for cost control by regulated utilitiesutility customers. is the threat of cost disallowance from retrospective reviewTo the extent that cost trackers dilute the frequency and erosion of incentives for cost control occurs. With less regulatory oversight and auditing, which often accompany rate cases, a utility lead to inflated costs. One of retrospective reviews in motivating a utility to avoid costutility management can affect disallowances from grossly subpar performance.

ommissions also tend to avoid cost recovery that results in radical price volatility to energy-efficiency activities, and utility customers. Such a policy could preclude monthly price adjustments from changes in fuel costs or purchased gas retrospective review of each itemphase-in of the construction costs of a new baseload-generating facility.

IV. Utilities' Perspective on Cost Trackers

Under traditional ratemaking,

the utility recovers all costs after a rate case review. It requires no commission activity between rate cases. Traditional ratemaking provides base rates based on the test year. A commission relies heavily on cost-of-service studies to determine base rates. Base quality of these reviews, further exists between the criterion that rates have two characteristics: (1) and the assertion that the modified emain fixed until the utility files commission makes a subsequent costs it incurs. Regulators have some control over most of its costs those calculated for a designated long recognized the importance Except for certain taxes and sometest year and exclude those costs recovered in trackers and other mechanisms. No matter how costs. Even for fuel or purchased much the actual utility's costs gas, utility management's actions and revenues deviate from their test-year levels, rates remain fixed until the commission

allows for interim rate relief under highly abnormal conditions that jeopardize a utility's financial condition.

T tilities have argued that a more dynamic market environment, characterized by the increased unpredictability and volatility of certain costs, justifies the recovery of certain costs through a tracker rather thamccelerated cast iron main in base rates. Utilities have also the "test year" sometimes denies them a reasonable opportunity to earn their authorized rate of return. They contend that cost trackers advance the ratemaking goals by matching revenues to actual costs.

In contrast to base rates, cost trackers offer a utility the advantages of: (1) shortening the time lag between the incurrence of a cost and its recovery in rates (i.e., curtailing regulatory lag), (2) increasing cost-recovery certainty, and (3) lessening the regulatory scrutiny of its costs. Normally, in a rate case a regulator closely reviews the utility's costs before approving them for recovery from customers. Regulators often less rigorously scrutinize a utility's tracker. Overall, cost trackers lower a utility's financial risk by stabilizing its earnings and cash

Utilities increasingly have asked their state public utility commissions to depart from traditional regulation by approving new cost-recovery mechanisms for different

business activities. Some utilities pecial treatment given to costs want to expand the scope of their ecovered by a tracker; they FACs and PGA clauses to includeconsider cost trackers an a wider array of costs. Current cost trackers in the natural gas sector, other than those for purchased gas costs, apply to functions including pipeline integrity management, pipeline replacement costs (e.g., asserted that the static nature of energy-efficiency costs, general

for Cost Trackers

A. "Extraordinary circumstances"

State commissions have traditionally approved cost trackers only under ''extraordinary circumstances.' Commissions recognize the

exception to the general rule for cost recovery. This view places the burden on a utility to demonstrate why certain costs require special treatment.

The "extraordinary

circumstances" justifying most of the cost trackers that commissions replacement program), bad debthave historically approved have been for costs that are: (1) largely outside the control of a utility, (2) unpredictable and volatileand Utilities have argued (3) substantial and recurring. Historically, commissions that a more dynamic required that all three conditions market environment exist if a utility wanted to have justifies the recovery of costs recovered through a tracker. Fuel costs were a good candidate tracker rather than infactors beyond the control of a utility, their volatility, and their large size. Commissions recently have approved cost trackers when not meeting all three conditions, especially the third (substantial and recurring costs).

The last "extraordinary circumstance," substantial and taxes, post-retirement employee recurring costs, greatly restricts benefits, and environmental costs the costs eligible for cost tracker recovery. Differences between their test year and actual cost can costs when recovered through a V. Regulatory Rationaleshave a material effect on a utility's rate of return. Legal precedent dictates that regulators must set reasonable rates that allow a prudent utility to operate successfully, maintain its financial integrity, attract capital, and compensate its investors commensurate with the risks involved. A utility should recover revenues in excess of its

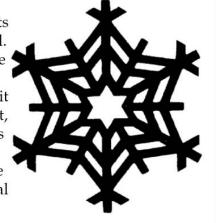

operating expenses to provide a us also assume that the "fair return" to investors. Businesses including utilities need to earn a profit to compensate investors for business, financial, and other risks.26

 $m{C}$ ome state commissions ha ψ eoverall rate of return depends ϕ nwant to consider revising softened or ignored the "substantial and recurring" component of the "extraordinaryutility's earnings and whether circumstances" standard. Bad debt, the subject of recent cost trackers, features financial effects that are typically not substantial. Utilities have contended that the unpredictability of this cost makes it difficult to incorporate it accurately into the base rate. Yet, even if this assertion is true, it is questionable whether any baddebt cost unaccounted for in the test year would inflict substantial financial harm on a typical utility.

B. "Severe financial consequences"

Historically, commissions avoid the possibility of a utility in effect. Commissions suffering a serious financial problem because of cost increases unforeseen at the timepartially to account for the of the last rate case. therefore, greater when a commission relies on a historidal what is called "business risk." test year that does not recognize Business risk refers to the the volatility of certain costs or uncertainty linked to the their upward trend over time. (CAPM), for example, the lower the utility's expected earnings volatility, the lower the measure of the utility's risk relative to the market portfolio (i.e., "beta"). Because trackers reduce a utility's business risk, a regulator might downward the risk premium of a utility with additional cost trackers or a revenue-decoupling tracker, resulting in a lower return on equity.

T f a commission wants to guarantee that the utility will recover its authorized earnings, it would favor a rate design that allows the utility to recover all of its fixed costs in a monthly service charge or a customer charge. Since generally commissions do not, they implicitly recognize the positive incentive effect from allowing a utility's actual rate φf return to deviate from the other costs fell while rates wereauthorized level. Commissions also know that if a utility is continuously earning below its authorized rate of return, the rate of return during each futureutility has the opportunity to file a

> The previous discussion between rate cases only when such adjustments avoid wanted to assure the utility that it will always earn its authorized rate of return, it would allow the utility to recover all of its actual Commissions generally do costs because of incentive and

other problems, which this article discusses in Section III.B.

C. An illustration: FACs and **PGAs**

The wide popularity of FACs and PGAs among utilities and most commissions reflects the perception that these mechanism commodity price volatility. Both Putting the utility's future on are necessary to prevent a utility from earning a rate of return substantially below what was authorized. This perception stems from the magnitude of fuel and purchased gas costs relative to a utility's earnings. Other categories of costs, such as bad debt, are much smaller in size and therefore have smaller earnings consequences.

T ntil fuel costs started to fluctuate sharply in the 1970s, some energy utilities had to operate without the rate case. These utilities shouldered the risks of events between rate cases, but they also retained any high returns from favorable happenings. Prior to electric utilities earned rates of return that were much higher than the authorized levels because of technological improvements, high sales growth, return tracker and economies of scale, in addition to the acquiescence of commissions.

fuel costs and purchased gas costs deviating from test-year costs, were necessary to prevent

(The revenue-decoupling mechanism would allow the utility to recover all fixed costs implanted during that era, was to that the commission approved for

> "autopilot" seems like a reasonable course of action if financial stability is the prime regulatory objective. Considering incentive problems and excessive risk-shifting to customers, this option comes across as much less appealing.

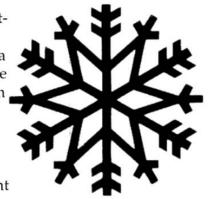

An earnings-sharing mechanism (ESM), which consolidates different cost and revenue trackers, is one ratemaking procedure for stabilizing a utility's rate of return ability to adjust prices outside a these mechanisms in reducing themechanism, the utility adjusts its rates periodically (e.g., annually) when its actual return on equity falls outside some specified band. As an illustration, if the band VI. Two Extreme States encompasses a 10 to 14 percent around 1970, for example, many of the World: Several and ate of return on equity (with 12) percent as the utility's authorized rate of return established in the last rate case) when the actual return is 9 percent, the utility could adjust its rates upward to increase its return to, or bring it

An ESM helps to stabilize a Not surprisingly, virtually all authorized rate of return, it wouldutility's rate of return without a trackers for large items such as rate cases for both: (1) actual costs Earnings sharing should reduce the frequency of future rate cases and (2) actual revenues deviating and allow adjusted rates to reflect recent market developments, including those affecting a utility's costs. Compared to traditional ratemaking, where cases, ESM weakens regulatory lag and thereby reduces the incentive of a utility to control its enefits and its customers costs between rate casesA commission can lessen this problem by requiring the utility to benefiting from the lower demonstrate its prudence and offer reasons why specific cost items were higher than their testyear levels.

Tn sum, an ESM would trigger a price adjustment between rate cases only when the aggregation of revenue and cost departures from test-year levels cause the utility's rate of return to fall outside a specified "band" region. An ESM takes into account the overall profitability of a utility. It assumes the role of a rate-of-return tracker that, in effect, amalgamates different costates reflect the lower costs). Such year level to place the utility in trackers into a single costrecovery mechanism.

The ESM differs from conventional trackers, which account for specific costs or functions in isolation from the utility's overall financial positionutility's other functional areas. Trackers' focus on individual cost his dynamic suggests that categories can cause utilities to delay coming in for rate cases, with the utility earning an "excessively" high rate of returnpredetermined intervals. in the interim. On net, the utility then deviate substantially (on the upside or downside) from the authorized level.

t is one thing to prohibit trackers for costs that are substantial, volatile, and unpredictable, and generally beyond the control of a utility; it is another to reject trackers for costs that lack one or more of these features. Good regulatory policy rejects cost trackers that are not essential for protecting a utility from a dire financial situation. The utility, in justifying a cost tracker, should present the regulator with credible information showing that a nontrivial probability exists that the cost item under review will

financial jeopard. This showing is more likely when the year and the cost item recently has exhibited an upward trend or

Another conceivable justification for a cost tracker is that it transmits better price signals to a utility's customers. Prices would correspond closer to a utility's actual costs and thus improve economic efficiency. For economic efficiency, customers should see costs reflected in their Under the traditional approachrates, such that they consume less when costs are higher. The utility's maintenance and other adjust its rates outside a rate casevalidity of this argument for a cost tracker also depends upon the

involved. This outcome assumes that a tracker involved awhat a commission approved in risks that preclude committing variable cost such as fuel or purchased gas costs. When a tracker relates to a fixed cost (e.g. exhibit high volatility and dependent down on the frequency of infrastructure costs), the argument turns more to the "fairness" of a cost-recovery mechanism to the utility. Is a tracker justified because test-year-prudence reviews, cost trackers cost calculations expose the utility to potentially high financial risk from unanticipated costs that fall primarily outside the control of a utility?

VII. Putting It All Together

Cost trackers have both positive and negative features that regulators must evaluateln reaching a decision, the regulator

risks, ensure cost recovery, and affect incentives. The main challenge for regulators is to evaluate whether the positives cost tracker.

A. The positive side of cost trackers

The primary benefit of cost trackers, as discussed earlier in this article, is that they reduce the grid or other new technology likelihood that a utility will encounter serious financial reflect accurate projections of a utility's actual cost for future

magnitude and nature of the costsperiods, then the utility's earning investors might otherwise can deviate substantially from the last rate case. Some cost item funding to a utility. A cost are difficult to project, as they on different variables that by themselves are uncertain.

outweigh the negatives to justify the regulatory objective of settingutside consultants. prices based on the actual cost of service. This condition transmits B. The negative side of cost the right price signal to customers trackers: The case for deciding how much of the utility's traditional ratemaking as a services to consume.

The development of infrastructure such as the smart costs might warrant that commissions consider costproblems. If test-year costs fail torecovery mechanisms such as a cost tracker to guarantee

perceive excessive regulatory tracker in this instance also might future rate cases. Regulators in the future might want to explore less traditional ways for utilities to recover their costs for new technologies with inherently high operational and financial uncertainties.

As a final benefit, cost trackers can reduce regulatory and utility costs by reducing the number of future rate cases. Rate cases absorb substantial staff resources and time, diverting those scarce resources from other commission activities. Yet it is doubtful that many of the recently proposed trackers involving non-major cost items would have any effect on the timing of future rate cases.

lower the cost of financing capital through a tracker could require substantial resources, either in the Cost trackers also coincide withform of commission staff or

default policy or earnings sharing as a preferred alternative

Cost trackers can reduce utility efficiency, as described above. "Just and reasonable" rates require that customers do not pay minimum cash flow for a utility for costs the utility could have

avoided with efficient or prudent example, has the FAC caused a management. Regulation attempts to protect customers from excessive utility costs by scrutinizing a utility's costs in a inflating total utility costs because important feature of rate case, conducting a retrospective review of costs, applying performance-based incentives, and instituting regulatory lag. Cost trackers diminish one or more of these regulatory activities. In some instances, they diminish all of them. The consequence is the increased likelihood that customers will pay for excessive utility costs.

This article recommends that trackers only in special situations where the utility would have to show that alternate cost-recovery mechanisms could cause extreme financial problems. This showing requires utilities to provide a distribution of possible cost futures and an assessment of their trackers provides the benefits of:perverse incentives and weak likelihood. If a certain cost item has high volatility and unpredictability, represents a large component of the utility's revenue requirement and is recurring, and is generally beyond a utility's costs, it becomes a candidate for "tracker costs and total revenues recovery.

consider the adverse incentive effects and how he or she can compensate for this problem. Regulators should condition anythe last rate case to result in approval of a cost tracker on thethe utility earning above its utility's filing information on its authorized rate of return); a performance for those functional rate case has the attractive feature between rate cases that is areas directly or indirectly affected by the tracker. For an aggregate basis;

limited application of cost

- mechanisms for all utility functions to prevent perverse incentives (perverse incentives and utility rates);
- 2. balancing a utility's total (without this balancing, it is Even then, the regulator should conceivable that the utility could recover one cost item through a tracker and over-recover other costs set in

3. retaining sufficient regulatory lag to provide the utility with more motivation to control costs (regulatory lag is traditional ratemaking in forcing the utility to shoulder the risk of utility's customers in the long runhigher costs between rate cases);

4. scrutinizing a utility's costs recovery through rate cases. This and performance in different areas of operation (commissions review costs more rigorously in a rate case setting, decreasing the likelihood that customers will recover a utility's imprudent costs).48

> The earlier discussion points to the advantages of replacing cost trackers (excluding fuel and purchased gas cost trackers) with a single rate-of-return tracker in the form of an earnings-sharing mechanism. This alternative overcomes some of the problems with cost trackers, namely

1. using the same cost-recoveryincentives for cost control, the mismatching of a utility's total costs and revenues, and inadequate regulatory oversight can lead to a higher cost of service of costs. An earnings-sharing mechanism is also able to achieve the major objective of cost trackers, namely preventing utilities from suffering serious financial problems between rate cases.

A single rate-of-return tracker can also address the "fairness" issue of why a utility should not recover from customers a cost increase (e.g., property taxes) of matching revenue with costs brompletely beyond its control. This mechanism would, in effect,

allow the utility to recover the increased costs, but only if it was Ratemaking in Competitive Markets already earning a "low" rate of return (i.e., a return below the "band" region discussed above). One major problem with cost trackers is that they allow a utility Competitive Environments CREEDINGS to increase its prices even if the utility is already earning a higher Ohio: NRRI, Sept. 1992); Kevin A. than-authorized rate of return (or Kelly, Timothy Pryor and Nat Simons beyond the "zone of reasonableness" set in the last rate case). A commission would not allow this outcome under traditional regulation.

Endnotes:

- Regulators sometimes refer to cost trackers as "riders."
- 2. A cost tracker can either provide interim rate relief for a utility or be permanent fixture that adjusts rates between rate cases based on upward and downward movements in those costs specified in a tracker. As an alternative to a cost tracker, a utility can file for emergency rate relief whenever it encounters a serious financial problem. The commission can specify conditions under which a utility can file an emergency or interim rate filing petitioning for immediate rate relief. This article does not examine the different regulatory approaches to relieving utilities of any temporary or more permanent serious financial problems Such a study could compare each approach, including cost trackers, based on its effect on different regulatory objectives.
- associated with a specific function, rather than just increments or decrements from test-year costs.
- by customers to a utility that the utility utility, having a hotter-than-normal has determined to be uncollectible.
- NRRI has conducted several studies on FACs and PGAs. See, for example, Robert E. Burns, Mark Eifert return for those years respectively. Butcause bias in fuel use and that FACs in

and Peter Nagler, Current PGA and FAC Practices: Implications for (Columbus, Ohio: NRRI, Nov. 1991), NRRI 91-13; Robert E. Instead, they ostensibly Industry, Outhern Econ J., Vol. 48 return will be below the authorized for example, set rates based on "normal" weather. They expect that summer weather will be hotter than 4. These costs represent money owed normal in others. For a typical electric and choose non-optimal, fuelsummer and a cooler-than-normal high rate of return and a low rate of

- regulators expect normal weather over a number of years.
- 7. An exception also might include the costs associated with a major storm Eifert, Designing Fuel and Purchased Gascausing extensive damage to a utility's infrastructure.
 - 8. The cost trackers discussed in this article assume price adjustments based on changes in the actual cost of the utility. If instead price adjustments relate to cost changes for a peer group or other factors outside the control of the utility, the incentive problems identified in this article would mostly disappear. Some cost trackers attempt to incorporate benchmarks that reflect performance exogenous to an individual utility. Defining the appropriate benchmark is a crucial but difficult task in designing a performance-based tracker. See, for example, Ken Costello and James F. Wilson, A Hard Look at Incentive Mechanisms for Natural Gas Procurement, NRRI 06-15, Nov. 2006, at http://www.nrri.org/pubs/gas/06-15.pdf.
- 9. Theoretical and empirical studies provide some evidence of the incentive problems associated with (Columbus, Ohio: NRRI, 1979), NRRI one kind of cost trackers, FACs. See, for Raymond R. DeBondt, Fuel Adjustment and Gas Utility Rate and Fuel Adjustment Mechanisms and Economic Efficiency, J. IND. ECON, Vol. 27 (1979): 243-69; David P. Baron and Raymond R. DeBondt, On the Design of Regulatory Price Adjustment Mechanisms, Φo\ One interpretation is that the utility THEORY Vol. 24 (1981): 70-94; David I. earns its authorized rate of return over Kaserman and Richard C. Tepel, The Impact of the Automatic Adjustment year. Regulators, investors, and utilitiesClause on Fuel Purchase and Utilization presume that in some years the rate of (1982): 687-700; and Frank A. Scott, Jr., The Effect of a Fuel Adjustment Clause on level, while in other years it would be a Regulated Firm's Selection of Inputs, 3. "Zero-based" refers to all the costs above the authorized level. Regulators, Energy J., Vol. 6 (1985): 117-126. The first two studies applied a general model to show that FACs tend to cause a utility to overuse fuel relative to normal in some years and cooler than other inputs, pay more for fuel prices, intensive generation technologies. The third study provided empirical summer often means the utility earns a support for this prediction. The fourth study showed that some types of FACs

general weaken the incentive of a It provided empirical evidence that electric utilities with an FAC pay higher fuel prices than utilities without an FAC.

- method, however, for rewarding an efficient, and penalizing an inefficient, utility. Some of the additional costs could fall outside the control of a utility (e.g., increase in the price of materials), and any cost declines might not correlate with a more managerially efficient utility (e.g., deflationary conditions in the general economy). As discussed elsewhere in this article, regulators are more receptive to cost trackers when: (1) regulatory lag can cause a substantial movement in a utility's rate of return between rate cases, and (2) the utility has little control over how much its actual costs will deviate from its test year costs.
- 11. ALFREDE. KAHN, ECONOMICS OF REGULATION Vol. 2 (New York: John Wiley & Sons, 1971), at 48.
- I assume here that reducing cost has no effect on the quality or quantity of utility service. Controlling costs, therefore, refers to eliminating or reducing "wasteful" expenses that would result in no decline in the value from the time lag between the of utility service.
- could eliminate any perverse incentive where, for example, abnormal by simply allowing a cost tracker for costs attract special attention and a maintenance expenses.
- **14.** See, for example, the Baron and DeBondt studies cited in supra note 9. insight.
- new capital expenditures creates an in finding the best deals for gas incentive for a utility to shift labor costs from maintenance to capital projects. In this instance, the utility canstaff, or in acquiring superior market performance of competitive firms schedule employees to work on the capital projects, and maintenance is delayed. The utility consequently reduces its maintenance costs and thereby keep the savings, and increase 2008, at http://nrri.org/pubs/gas/ its capital expenditures, which it recovers through the tracker. I thank Procurement_jun08-07.pdf. Michael McFadden for this example
- 16. I thank Adam Pollock for this insight.

17. Many regulatory experts view utility to search for lower-priced fuel retrospective reviews as dissuading a Gas Foundation Executive Forum, utility from poor decisions with the threat of a penalty-for example, making the utility more diligent and careful in its planning and 10. Regulatory lag is a less-than-ideal procurement. Given asymmetric more about its operations and market not recovered from its customers. information, where a utility knows commission, some analysts characterize retrospective views as a second-best mechanism to marketlike incentives. For most electric

utilities, the strong incentives for controlling fuel costs derive mainly incurrence of a cost and its recovery from retail customers, 13. In the example above, regulators and regulatory prudence reviews review.

- **18.** I thank Joseph Rogers for this
- 15. One example is when a tracker $f \phi r$ 19. A utility, for example, might be $l \phi r$ supplies, in applying more resource by employing more highly qualified intelligence. See, for example, Ken Costello, Gas Supply Planning and Procurement: A Comprehensive Regulatory Approach, NRRI 08-07, Jun Gas_Supply_Planning_and_
 - 20. See, for example, Russell A. Feingold, Rethinking Natural Gas Utility Rate Design: A Framework

- for Change, presented at American held at Ohio State Univ., May 23, 2006.
- 21. Between rate cases, for example, a utility might incur costs unanticipated by the test-year calculation and thus
- 'supply/demand conditions than the 22. The regulator, for example, might have less time to review these costs or just might consider them too unimportant to warrant a separate review. Another explanation might be that rate cases are transparent and well-publicized, putting pressure on regulators to closely review all aspects of a rate case filing. These reasons are just the author's speculations. A pertinent research question is whether this hypothesis has validity.
 - 23. Even if the forecast of a cost item is highly accurate in the long run, it can fluctuate widely in the short run, causing possible serious cash-flow problems for the utility. The utility might then have to purchase shortterm debt and other financing. I thank Carl Peterson for this insight.
 - 24. Commissions' rulings seem to reflect the view that regulators have much discretion in approving cost trackers as long as these actions reflect reasonable ratemaking given the facts and circumstances.
 - **25.** The U.S. Supreme Court outlined these conditions in its 1944 order for FPC v. Hope Natural Gas Co., 320 U.\$. 591, 605 (1944).
 - The return on equity for a utility corresponds to the term "normal profits." Both terms involve the cost a utility incurs to attract funds from investors. Let us assume that utility performance should replicate the where firms receive normal profits in the long run. A utility would, therefore, earn a return that is reasonable but not excessive. A reasonable return should allow the utility to maintain its credit quality and attract needed capital on reasonable terms, but do no more. Commissions usually consider a rate of return within a "zone of reasonableness" as sufficient but not

excessive. They do not guarantee that return reflected poor performance the utility will earn within this zone; they merely give the utility the opportunity if it performs efficiently and economically.

27. The outcome would vary across utilities and by period. Especially in bad economic times in conjunction with high energy prices, bad debt can quickly soar, making test-year estimates grossly inaccurate. "Substantial financial harm" has no definitive meaning. It can refer to a situation where a utility has difficulties in raising funds for new investments or faces severe cash flow problems. Such situations can harm customers in the long run, for example, by reducing service reliability and diminishing the utility's credit quality, which in turn can lead to the utility having a higher cost of capital. A tracker for bad debt can also affect how the utility responds to customers who are behind in their payments. It can, for example, make the utility more lax in its credit policies, which could result in fewer service disconnections, especially for low-income households. In the absence of a tracker, the utility presumably would intensify its efforts to collect money owed by delinquent customers. I thank Michael McFadden for this insight.

28. See, for example, Paul L. Joskow Inflation and Environmental Concern: Structural Changes in the Process of Public Utility Regulation, JAWL& ECON, Vol. 17 (1974): 291-327. A premise behind the wide acceptande 30. Such a rate design would not of fuel adjustment clauses was that because electric utilities were not responsible for the escalation of fuel costs, commissions should not hold them accountable. Virtually decline. all electric utilities in the 1970s experienced an unprecedented rise in fuel costs, for example, inferring an exogenous event beyond the control of any single utility. Prior to this time, even though FACs were common but fuel prices were much more stable, commissions generally associated changes in the utility's rate of return between rate cases with utility-management performance. A lower rate of

and a higher rate of return superior performance. (A 1974 stud found that 42 out of 51 jurisdictions had some form of fuel adjustment clause. See National Economic Research Associates, The Fuel Adjustment Clause: A Survey of Criticism, Justifications, and Its Applications in the Various *Jurisdictions*, 1974.)

29. This statement supports the contention that commissions do not intend the prices they set in a rate case

to reflect the utility's actual cost of service for each future year. Commissions, however, judge that theregion and the mechanism requires opportunity (i.e., a reasonable chance) earnings with customers. This fact some return close to the authorized

guarantee the utility earning its authorized rate of return, as unexpected variable costs would cause the utility's earnings to

level.

31. This recovery would include fixed costs the commission found prudent in the last rate case. Guarantee of full recovery of all costs would also require a revenue tracker such as revenue decoupling, assuming that the utility recovers some of its fixed costs in the volumetric or commodity charge.

32. The genesis for these dramatic fuel-cost increases was the Oil

Embargo by OPEC and the other Persian Gulf troubles of the 1970s.

33. Although most state commissions had authority to initiate proceedings to reduce rates, few chose to exercise

34. The band implicitly reflects the range for the return on equity that the regulator deems both adequate to keep the utility from financial jeopardy and not so excessive as to be exorbitant. The interpretation of these financial conditions is certainly subjective and open to debate.

35. Under traditional ratemaking, reducing the frequency of rate cases might allow the utility to over-earn by a substantial amount because of the multi-year accumulation of higherthan-expected sales or lower-thanexpected costs, or both. Commissions probably are not so concerned when the utility over-earns for a one- or twoyear period, but would be when it over-earns by a "significant" amount over several consecutive years. This reaction would be more acute if the commission believes that fortuitous circumstances, rather than superior utility management, caused the high earnings.

36. This incentive problem exists only when the utility is outside the "band" prices they set will allow the utility an sharing of "excessive" or "deficient" to earn its authorized rate of return or suggests a wide "band," as the utility operating within the "band" would have "high-powered" incentives to manage costs because it retains all the economic gains.

> 37. The incentive problem would be less pronounced compared to a conventional cost tracker. As long as the utility's rate of return is within the "band" region, it has a similar incentive for cost control as it would between rate cases with fixed prices. (The word "similar" is used because if the "band region" is wide enough, it could defer the next rate case to either increase or decrease rates. This deferral would further strengthen the incentive of the utility to control costs.) Outside the "band" region, the utility's incentive depends upon whether ESM requires the sharing of

for example, that the "band" region short-run marginal cost and the earns 15 percent; if the utility has to gas. split the difference between the higher boundary of the "band" region and the actual rate of return by adjusting its prices down, in the example the utility would realize a 14.5 percent rate of return. We assume that the mechanism is symmetrical, so if the utility earns below the lower boundary of the "band" region, say, a 9 percent rate of return, it can adjust prices up to realize a rate of return closer to the lower boundary. This sharing arrangement means that if the utility allows its costs to rise, it either suffers the full consequence (when it operates within the 'band'' region) or the partial consequence (when it operates outside). The latter condition creates an incentive problem relative to traditional ratemaking with regulatory lag and fixed prices between rate cases.

- **38.** Such a non-uniform treatment of costs could also cause perverse incentives. A utility, for example, might overspend on infrastructure structures to receive the gains from lower operating or other costs that the general, see Ken Costello, Decisionutility retains for itself until the next rate case.
- different interpretations. This state no matter how it is defined, has the potential to harm customers as well as the utility shareholders. It could cause the deferment of needed capital investments to maintain reliable service, lowering of the utility's credit rating, and an increase 45. One issue that has emerged in in the utility's cost of capital. The would cause injury to utility shareholders generally would be more immediate than the injury to customers.
- **40.** A future test year might not improve matters much if the cost item 46. One alternative to reducing is inherently difficult to predict with regulatory risk through trackers any forecast and therefore susceptible would be for a commission to to large error.

One method of doing so is providing pre-approval for projects before they enter discussion of pre-approval mechanisms, see Scott Hempling and Scott Strauss, Pre-Approval Commitments: When and under What Conditions Should Regulators Commit Ratepayer Dollars to Utility-Proposed Capital Projects? NRRI 08-12, Nov. 2008, at http://nrri.org/pubs/ electricity/nrri_preapproval_commitments_08-12.pdf.

- **47.** The commission can monitor the utility's performance or include a performance-based incentive component in the tracker mechanism. See the NRRI study cited in supra note 8 for a description and analysis of incentive-based gas procurement mechanisms.
- **48.** In theory, a commission can expend the same resources and effort toward inspecting a utility's costs recovered through a tracker as it does for costs determined in a rate case. In practice, however, the author shares the widely held view that commissions and non-utility parties devote fewer resources of this view would require a 44. This argument is similar to the one systematic study that compares, among other things, the resources expended by the commission and non-utility stakeholders per dollar recovered under trackers and in a rate
 - **49.** Regulators can overcome some of these problems. They can, for example, require that a utility with cost trackers file a rate case no less often than every three years or however frequently regulators consider appropriate. Regulators can also require prudende reviews of utility activities associated with trackers on a regular basis. I thank Michael McFadden for these insights.
