I.

INTRODUCTION AND SUMMARY

Q1. Please state your name, occupation and business address.

A1. My name is Bente Villadsen and I am a Principal of The Brattle Group, whose business address is One Beacon Street, Suite 2600, Boston, MA 02108.

Q2. Are you the same Bente Villadsen who provided direct testimony in this proceeding?

A2. Yes. I provided prefiled direct testimony on behalf of the Municipality of Anchorage d/b/a Municipal Light and Power Department ("ML&P" or the "Company") on December 30, 2016.

Q3. What is the purpose of your reply testimony?

A3. The purpose of this testimony is to respond to the prefiled direct testimony of Federal Executive Agencies ("FEA") witness Michael P. Gorman and Providence Health and Services ("PHS") witness Daniel J. Lawton on topics related to ML&P's allowed rate of return ("ROR") on rate base and allowed return on equity ("ROE").

Q4. Please summarize the conclusions of your reply testimony.

- A4. I conclude the following:
 - The testimonies of Mr. Gorman and Mr. Lawton do not provide persuasive evidence that changes my recommended ROE of 13%. My reply testimony will discuss the specific defects and issues in the testimonies of Mr. Gorman and Mr. Lawton.

PREFILED REPLY TESTIMONY OF BENTE VILLADSEN
Docket No. U-16-094/U-17-008
September 22, 2017
Page 3 of 55

23

24

1	• The RORs proposed by Mr. Gorman and Mr. Lawton are substantially below the
2	norms in the industry despite ML&P's higher than average risk.
3	• It is vital to recognize the need to determine a reasonable overall return for ML&P
4	given the recently allowed RORs for other electric utilities and reject the
5	given the recently anowed RORS for other electric durines and reject the
6	unreasonably low recommendations of FEA writiess Gorman and FHS writiess
7	Lawton.
8	• Mr. Gorman does not consider the differences in financial risk between ML&P
9	and the sample companies when determining the ROE.
10	• Mr Lawton incorrectly measures the impact of financial risk (i) using multiplier
11	below what is most "indicative" of the effect and (ii) based (on book value of
12	conital structure rather than market value. Therefore his measure fails to
13	
14	adequately adjust for differences in financial risk.
15	• My recommended ROE accounts for the financial risk using methods widely
16	accepted by financial literature and practitioners.
17	• Mr. Gorman's primary recommendation implies an unreasonably low ROE for
18	ML&P that he projects to be below the overall ROR His recommended ROE is
19	balow that of any integrated U.S. utility over the last 10 years
20	below that of any integrated 0.5. utility over the last 10 years
21	• Mr. Gorman's arguments regarding the ECAPM should be given no weight as the
22	Blume adjustment to beta and the ECAPM are two separate adjustments with no
23	redundancy between them.
24

Mr. Lawton's failure to use forward-looking interest rates biases his cost of equity estimate downward.

Q5. How is your reply testimony organized?

A5. First, I address the overall reasonableness of the RORs and ROEs proposed by witnesses for FEA and PHS. Second, I address the impact of financial leverage on ML&P. Third, I address the relative risk of ML&P. Fourth, I provide comments on the other witnesses' methodologies and inputs to the cost of equity models as well as responses to their specific critiques of my analytical approach. Finally, I discuss the impact on ML&P's overall ROE from including the Beluga River Unit natural gas field ("BRU") as part of the Company's consolidated capital structure.

13 II. OVERALL REACTIONS

Q6. What rate of return recommendations have been provided in this case?

A6. Figure 1 below presents a summary of the recommendations filed in the direct testimony of witnesses for FEA and PHS, as well as ML&P's proposed ROR.

A7. As noted in my prefiled direct testimony, p. 6, the return to equity owners must be commensurate with returns on investments in other enterprises having corresponding risks. The recommendations of witnesses Gorman and Lawton are simply too low to reflect actual investor required returns.

Because of ML&P's low equity ratio a direct comparison of ML&P's ROE and that of other integrated electric utilities is not straightforward, so the direct comparison includes a discussion of ROR, which ultimately determines what ML&P's customers will pay for capital. The RORs proposed by Mr. Gorman and Mr. Lawton are substantially below the norms in the industry despite ML&P's higher than average risk. The average and median allowed ROR for vertically integrated electric utility rate cases since 2016 are 7.04% and 7.3%, respectively.² Thus, the overall rate of return on rate base proposed by Mr. Gorman is 149 to 263 basis points below prevailing regulatory norms, while Mr. Lawton's proposed ROR is 114 basis points below the industry average. ML&P has requested an ROR of 7.15%, which is consistent both the average and mean of the recently allowed rates of return for the average and median vertically integrated electric utilities. It is also slightly below the overall ROR of 7.39% allowed by the Commission in the prior proceeding.³ Figure 2 summarizes this information on allowed and proposed rates of return. And, importantly, these are trailing data and ML&P is asking for

approval of going-forward rates, all in an era of rising interest rates. As a point of reference for overall returns, the yield on long-term BBB-rated utility debt averaged 4.5% during the months of March to June 2017.⁴ As shown in Figure 2 below, not a single vertically integrated electric utility received an ROR as low as what Mr. Gorman has proposed for MLP in this proceeding. An ROR as low as 4.41%, which is below the cost of BBB-rated debt, is simply much too low.

III. FINANCIAL RISK AND COST OF EQUITY

Q9. Why do you devote a section to financial risk?

A9. Financial risk or capital structure is a large topic in financial economics and it is commonly recognized in finance textbooks that financial leverage impacts the cost of equity for a company. This is important to ML&P because ML&P currently has substantially more financial leverage (debt) than the sample companies. The issue is illustrated in the excerpt of text from a standard MBA textbook is provided below:⁶

COMMON MISTAKE Is Debt Better Than Equity?

Because debt has a lower cost of capital than equity, a common mistake is to assume that a firm can reduce its overall WACC by increasing the amount of debt financing. If this strategy works, shouldn't a firm take on as much debt as possible, at least as long as the debt is not risky?

This argument ignores the fact that even if the debt is risk free and the firm will not default, adding leverage increases the risk of the equity. Given the increase in risk, equity holders will demand a higher risk premium and, therefore, a higher expected return. The increase in the cost of equity exactly offsets the benefit of a greater reliance on the cheaper debt capital, so that the firm's overall cost of capital remains unchanged.

As Professors Berk and DeMarzo further note:

The levered equity return equals the unlevered equity return, plus an extra "kick" due to leverage. ... The amount of additional risk depends on the

25

KEMPPEL, HUFFMAN AND ELLIS A PROFESSIONAL CORPORATION 255 E. FIREWEED LANE, SUITE 200 ANCHORAGE, ALASKA 99503-2025 (907) 277-1604

A PROFESSIONANAN AND ELLIS A PROFESSIONAL CORPORATION 255 E. FIREWEED LANE, SUITE 200 ANCHORAGE, ALASKA 99503-2025 (907) 277-1604

KEMPPEL,

1	Shareholders demand a correspondingly higher return because of this <i>financial risk</i> . ⁹
2	Similarly, Professors Berk and DeMarzo summarize the effect of leverage on the cost of
4	capital as follows.
5	[L] everage increases the risk of equity even when there is no risk that
6	<i>the firm will default.</i> Thus, while debt may be cheaper when considered on its own, it raises the cost of capital for equity. Considering both sources of capital together, the firm's average cost of capital with leverage is the same as for the unlevered firm. ¹⁰
8	These statements by preeminent finance scholars in widely-used Corporate Finance
9	textbooks highlight two important points that can also be intuitively observed based on
10	the real estate investment example:
11	• The variability of returns on the asset itself (e.g., the piece of real
12	estate) is unchanged by the introduction of financial leverage, therefore "leverage does
13	not affect the risk or the expected return on the firm's assets." Rather, it is the risk and
14	required returns of the equity and debt financing instruments that are changed by the
16	degree of financial leverage.
17	• The mechanism by which leverage adds variability to equity
18	returns is independent of any effect of increased leverage on the risk that the firm will be
19	unable to fulfill its fixed financial obligations, and thus (as Berk and DeMarzo put it)
20	"leverage increases the risk of equity even when there is no risk that the firm will
21	default."
22

AND ELLIS

HUFFMAN

KEMPPEL,

24

25

1

2

3

4

012. Can you illustrate using your real estate example why market value leverage must be the relevant measure for determining the financial risk affecting equity investors?

Yes. Suppose in the above real estate example that the investor had invested in real A12. estate 15 years ago, taking a \$50,000 mortgage to purchase a property worth \$100,000. Further assume that in the 15 years since the purchase, accounting depreciation has reduced the book value of the property to \$70,000, while the investor has paid her mortgage down to a remaining balance of \$30,000. The book value of the investor's equity investment is therefore 40,000 (= 70,000 - 30,000).

To calculate the economic returns to the equity investor (owner) if (for example) real estate prices rise or fall 20%, one needs to know how real estate prices have developed over the past 15 years. For example, if the market value of the property is now \$200,000, then a 20% change in the price of real estate represents a \$40,000 gain or loss, equal to 100% of the investor's book value of the equity investment.

The market returns to the investor, however, is measured relative to her market value equity in the property: \$200,000 less the \$30,000 outstanding mortgage balance,¹¹ or \$170,000. Therefore, when real estate prices change by 20%, the market return on the investor's equity is +/-23.5% (= \$40,000 / \$170,000), compared to +/-100% (= \$40,000 / \$40,000) return on the book value of equity investment.

PREFILED REPLY TESTIMONY OF BENTE VILLADSEN 26 Docket No. U-16-094/U-17-008 September 22, 2017 Page 15 of 55

¹¹ Technically, this assumes the market value of the mortgage (i.e., the price a lender would pay for it at current market interest rates) is equal to the outstanding balance, but any discrepancy between market and carrying value of the mortgage would not change the effect of the example.

The lesson from this example is clear. It is obviously not correct to say that a 20% drop in housing prices will wipe out the investor's equity, or that a 20% increase in housing prices would double it, as implied by the book value. Using book values would imply much different variability of expected returns—and thus different risk—than what is actually experienced by the investor. Therefore, when measuring the financial leverage of market-traded assets, market values should be used. More generally, financial leverage should always be measured based on the capital structure that dictates the risk and return of the investment.

B. <u>Response to Criticisms of Financial Risk Methodology</u>

Q13. What methods do you use to account for differences in financial risk?

A13. As described in my direct testimony, I consider several methods to ensure that no one method unduly biases the estimation process. The most commonly used method in modern finance theory as presented in textbooks and employed in practice is versions of the Hamada method, which converts the equity beta that is estimated for each proxy company into the so-called unlevered beta (or assets beta) that would apply if the proxy company were hypothetically financed by 100% equity. As an alternative and for the DCF method, I also calculate the overall cost of capital as a weighted average of the cost of equity and the after-tax cost of debt and attempt to ensure that customers pay the same for capital regardless of capital structure as illustrated in Figure 2 of my direct testimony.¹²

¹² Prefiled Direct Testimony of Bente Villadsen ("Villadsen Direct Testimony") at 15.

Q14. How did you measure leverage in performing your cost of capital calculations?

A14. I measure leverage using the same type of data as used in the models to ensure an apples-to-apples measurement. The CAPM and DCF approach rely on measurements of beta and dividend yield that are determined for the capital structures inherent in the market data for the sample. Thus, I also use market value capital structures. Because the CAPM as implemented uses *Value Line* betas, which are estimated over a five-year period, I use a five-year capital structure for the sample, whereas the DCF methodology uses market value capital structure data from a moment contemporaneous with the market price data I use for the dividend yield calculation. For the risk premium analyses, which use allowed return on equity (commonly applied to the book value of equity), I measure the financial leverage using book value.

Q15. What differences in financial leverage did you have to account for in your measurements?

A15. To the extent that the degree of financial leverage differs among the sample companies, the difference must be taken into account to arrive at an accurate capital cost estimate. For example, as illustrated in my direct testimony Exhibit BV-03, Table No. BV-ELEC-13, El Paso had a 5-year average debt to market value ratio of 44.3%, compared to 35.1% for Public Service Enterprise (see column [5]). Therefore, even though their equity betas (as measured by *Value Line*) were the same (at 0.70 as shown in column [1] of Exhibit BV-03, Table No. BV-ELEC-13), El Paso's equity beta reflected more financial risk due to its greater financial leverage. Consequently, the unlevered "asset beta" (calculated using either version of the Hamada unlevering technique in

PREFILED REPLY TESTIMONY OF BENTE VILLADSEN Docket No. U-16-094/U-17-008 September 22, 2017

Page 17 of 55

columns [7] or [8]) is lower for El Paso than for Publ. Serv. Enterprise, indicating the 1 2 fact that El Paso's equity beta reflects a higher degree of financial risk and a lower degree 3 of systematic business risk, which is measured by the unlevered beta. 4 With respect to my DCF calculations illustrated in Exhibit BV-03, Table 5 No. BV-ELEC-7, Panel A, consider a comparison of Ameren Corp. and OGE Energy. 6 The DCF cost of equity (column [3]), measured using market stock price and dividend 7 data, was approximately 90 basis points higher for Ameren Corp. (9.7%) than for OGE 8 Energy (8.8%). However, the overall after-tax cost of capital estimates (column [10]) for 9 Ameren Corp. and OGE Energy were much closer (at approximately 6.7% and 6.8%, 10 respectively). This reflects that fact that Ameren Corp.'s higher contemporaneous debt to 11 market value ratio (39.8% vs. 29.6% for OGE Energy, as shown in column [8]) imparts 12 13 higher financial risk that accounts for the higher expected equity return demanded by 14 investors when they purchase Ameren Corp.'s stock. 15 Q16. When calculating averages across the sample companies, what quantities provide an 16 indicator of the business risk of the sample? 17 A16. The unlevered beta and overall after-tax cost of capital control for differences in financial 18 19 leverage among the sample companies and the financial leverage used for rate making 20 purposes. Therefore, it is these quantities that can be meaningfully compared and 21 averaged on an "apples to apples" basis. Conversely, it is *not* appropriate to base cost of 22 equity estimates on simple averages of the directly calculated cost of equity estimates or 23 equity betas for the sample companies, as Mr. Lawton and Mr. Gorman do. Taking such 24 an average effectively combines apples and oranges by incorporating estimates affected 25 PREFILED REPLY TESTIMONY OF BENTE VILLADSEN

Docket No. U-16-094/U-17-008 September 22, 2017 Page 18 of 55

AND ELLIS 255 E. FIRE ANCHORAG KEMPPEI

by *both* business risk *and* differences in financial leverage. It therefore does not measure ML&P's cost of equity at its rate making capital structure. Looking simply to an average beta also fails to consider that there may be a range of reasonable ROE estimates and the importance of placing the target company within that range. I adjust the results of my risk premium approach in order to represent the

differences in financial risk between the allowed equity share in the capital structure of other electric utilities and the equity share for the Company. I determine through my risk premium analysis that a reasonable ROE for the average utility is 10.2%, given the historical relationship between allowed ROEs and risk-free rates.¹³ However, the average electric utility has historically been allowed a regulatory capital structure with 48% equity. This is significantly higher than ML&P's equity share in its capital structure, indicating that ML&P has more financial risk than the average electric utility – as measured by the regulatory capital structure used to set the allowed ROEs. Ignoring this evidence – as do the intervenors – would unreasonably bias downward the overall return allowed for the Company. I find that a 13% ROE allowed on 35.5% equity would provide a comparable overall return to that of the average electric utility based on the risk premium analysis. This analysis appropriately accounts for these differences in financial risk and consistently compares allowed returns on an "apples to apples" basis.

Since you measure the sample's business risk based on averages of the unlevered 017. beta (assets beta), how do you derive the equity beta and cost of equity capital that are representative for ML&P?

As described in my direct testimony,¹⁴ the Hamada adjustment technique applies the A17. estimate of unlevered business risk (i.e., the risk of the underlying assets independent of financing) to ML&P by re-levering the average assets beta at its requested regulatory capital structure, consisting of approximately 35.5% equity. I do the same with respect the sample average overall after-tax weighted average cost of capital estimates that I derive for the DCF and CAPM.

Q18. What justifications do the other cost of capital witnesses in this proceeding offer to reject the financial risk adjustments you performed in your direct testimony analysis?

Although the other cost of capital witnesses acknowledge that financial leverage A18. increases financial risk to equity investors and increases the cost of equity,¹⁵ they dispute the use of a formal model to measure the impact. For example, Mr. Gorman argues that both Value Line and S&P assess a company's financial risk based on its book value leverage, book value cash flows, and the earnings on its book value common equity.¹⁶

structures for each proxy company. She then uses this market ATWACC and each company's book value capital structures to derive a return on equity that produces the same ATWACC on the proxy group's book capital structure that was produced on its market value capital structure.²¹

Mr. Gorman also states, "Dr. Villadsen proposes to upwardly adjust her CAPM and DCF model results for the difference in financial risk based on the proxy companies' market value of common equity, compared to their book value common equity."²²

These statements are simply incorrect. My adjustments for financial leverage in no way rely on the book value capital structures of the proxy group companies. Rather, I use the textbook approach of determining the average asset beta—appropriately measured using market returns and the consistent capital capitalization data—for my sample companies and relevering that asset beta to an equity beta using the capital structure that ML&P's will earn a return on. I also look to the overall cost of capital as determined using the market-value capital structure of the sample companies and derive an ROE from that, which is consistent with ML&P's proposed regulatory capital structure.

Mr. Gorman's apparent misunderstanding of my methods of accounting for financial risk may explain his further mischaracterization of my position as a "belief that there are two levels of financial risk," or that "firms have a different level of

financial risk, depending on whether one is observing their market value capital structure or the book value capital structure."²³

Q20. Do you, as Mr. Gorman states, believe that there are two levels of financial risk?

A20. No. There is only one measure of financial risk, and that measure needs to be consistent with the data used to derive the return on equity. Thus, if I use market data to derive the cost of equity as is the case for the CAPM and DCF based models, then financial risk is based upon market value. This proposition is supported and accepted by modern finance theory and every textbook on corporate finance of which I am aware.²⁴ Further, the view is not just an ivory-tower creation. Duff & Phelps, a respected commercial provider of cost of capital data relied on in the "real world," also uses market-value capital structure in the cost of capital estimates.²⁵

Every day experience also indicates that market value is the measure of financial risk. As illustrated above using the example of a real estate investor, it is the appraised market value of the property—not the original purchase price or other book value measure—that is relevant in determining how debt (a mortgage) affects the investor's equity return when home prices change. The larger the percentage of the *appraised market value* that is financed with a mortgage, the larger will be variability in

your equity return as the property's value varies. This share changes as market values change, even if the property's "book value" is unchanged.

Q21. Does Mr. Lawton accurately describe how you measured financial risk?

A21. No. Mr. Lawton states that "Value Line shows historical and forecasted equity capital ratios for the comparable group at around 50%."²⁶ He suggests that I used "inflated equity levels" which overstate the financial risk differences between ML&P and the comparable sample group.²⁷ This is simply not true. Mr. Lawton fails to recognize that I, like every finance textbook I am aware of as well as the CFA curriculum, measure the cost of equity in the CAPM, ECAPM and DCF models, using market based data and consistent with finance theory, financial risk based on the same metric (market values). For example, the CFA curriculum states:

Financial Risk is the uncertainty of net income and net cash flows attributed to the use of financing that has a fixed cost, such as debt and leases. The greater the use of fixed-financing sources of capital, relative to variable sources, the greater the financial risk. In other words, a company that relies heavily on debt financing instead of equity financing is assuming a great deal of financial risk.²⁸

²⁷ *Ibid*.

25 ||

PREFILED REPLY TESTIMONY OF BENTE VILLADSEN Docket No. U-16-094/U-17-008 September 22, 2017 Page 24 of 55

²⁶ Lawton Direct Testimony at 54-55.

²⁸ Bookshelf Online: 2016 CFA Level I Volume 4 Corporate Finance and Portfolio Management.

The CFA curriculum then goes on to say that accounting for differences in financial leverage "requires a process of 'unlevering' and 'relevering' the beta." The manual specifically prescribes the use of market values for this purpose.²⁹

Mr. Lawton refers to *Value Line*'s report on Alliant Energy, noting that "Value Line shows the actual 2016 equity ratio for Alliant Energy at 47.2% projected by Value to increase to 48% by 2020."³⁰ He refers to the accounting or book value capital structure, but ignores the portion of Value Line's report detailing the "Capital Structure as of 3/31/17."³¹ *Value Line* presents the book value of debt (\$4.3 billion) as well as the market value of equity (\$9.4 billion) in this section, which implies an equity ratio of approximately 69%.³² Mr. Lawton is simply incorrect that I employ inflated equity ratios in my analysis.

Q22. Isn't it true that *Value Line* and credit rating agencies measure financial risk with reference to book values as noted by Mr. Gorman?

A22. Yes and no. Credit rating agencies are concerned with the credit worthiness of debt

PREFILED REPLY TESTIMONY OF BENTE VILLADSEN Docket No. U-16-094/U-17-008 September 22, 2017 Page 25 of 55

²⁹ *Id*. I note that in the CFA formula, the taxes are ignored, so that the formula is comparable to what I labeled "Asset Beta without Taxes."

³⁰ Lawton Direct Testimony at 57.

³¹ See "MPG Confidential WP 10", which contains the relevant *Value Line* report for Alliant Energy.

³² \$9.4 billion / (\$9.4 billion + \$4.3 billion). Note that this is larger than the equity ratio I use in my direct testimony given difference in when the capital structure was measured. In addition, I use the market value of long-term debt for consistency. As a result the value of the long-term debt I use in the sample companies' capital structure is higher than what is reported by Value Line (or on the companies' balance sheet), but consistent with the companies' reported "fair value" of long-term debt.

issuing entities; their ability to pay interest and repay debt. As noted above, they are only 1 2 indirectly concerned with the cost of equity capital. To ensure credit worthiness, credit 3 rating agencies rely upon accounting and other information to calculate financial ratios to 4 measure the financial health of a company. Using primarily accounting information 5 allows for consistency between companies when evaluating the credit worthiness of a 6 company. A credit report based upon market information would need to be updated 7 frequently. 8 Regardless of how credit rating agencies determine credit worthiness, the determination 9 of the cost of equity is necessarily different as equity investors have no "guaranteed" 10 periodic payment and are behind bond holders in case of default. 11 As for Value Line, as noted above, the investor service reports companies' 12 13 "capital structure" using the book value of debt and the *market* value of equity. 14 2. Mr. Gorman Makes No Adjustment for Financial Risk 15 **O23**. Does Mr. Gorman make an adjustment for the difference in financial risk between 16 ML&P and his sample? 17 A23. No. In his primary recommendation, Mr. Gorman does not consider the differences in 18 19 financial risk between ML&P and other utilities; in fact, he makes no effort to consider 20 questions of return at all. He instead bases his recommendation on coverage ratios rather 21 than the risk of and return on equity.³³ Mr. Gorman even ignores the differences in 22 financial risk between ML&P and his sample group in his alternative recommendation, 23 ³³ Gorman Direct Testimony at 3. 24

PREFILED REPLY TESTIMONY OF BENTE VILLADSEN Docket No. U-16-094/U-17-008 September 22, 2017 Page 26 of 55

25

which proposes an ROE of 8.5%³⁴ and an ROR of 5.55%.³⁵ Finally, he suggests that methods such as the ATWACC and Hamada Adjustment are inappropriate in the regulatory context.³⁶

Q24. How do you respond to Mr. Gorman's assertion that the ATWACC is poor regulatory policy?

A24. Mr. Gorman discusses three reasons that he believes the ATWACC would be poor regulatory policy,³⁷ but none of the reasons are accurate. First, he claims that the ATWACC is not transparent. This is puzzling as the approach is discussed in every MBA text I know of and the FERC in a recent decision explicitly referred to the method as "transparent."³⁸ Nothing I am recommending would change how a regulated company manages its capital structure or its reporting requirements to its regulator.

Second, Mr. Gorman claims that the ATWACC would somehow eliminate a utility's ability to hedge its market costs,³⁹ but the overall after-tax cost of capital or the

Hamada methodology has nothing to do with this ability. I agree that the cost of capital changes between rate cases, but between rate cases, the allowed ROE and revenue requirement would not change in any way that is related to how the ROE originally was determined. This whole objection is simply incorrect. Of course, the cost of capital may change with the next rate case but that is because the cost of debt and equity has changed and has nothing to do with how financial leverage is considered in determining the ROE.

Third, Mr. Gorman claims that the ATWACC inflates the equity return for utility investors.⁴⁰ Again, this is not accurate. The consideration of financial leverage simply recognizes that financial risk is important and should be recognized when setting the allowed ROE. It is not an "adder" as Mr. Gorman claims; rather it is symmetrical in its application: as financial leverage decreases, so does the required return on equity, and vice versa.

Q25. How do you respond to Mr. Gorman's critique of the Hamada methodology?

A25. With regards to the Hamada methodology, Mr. Gorman believes that the Hamada methodology "unjustly" increases the CAPM results and should therefore "be completely disregarded by the Commission."⁴¹ Yet Mr. Gorman provides no basis for this assertion and presents no evidence refuting the application of the Hamada methodology. The Hamada adjustment technique is a common practice amongst finance practitioners and is

widely accepted in academic literature.⁴² It is symmetrical in its application, meaning that as financial leverage decreases, so does the required return on equity, and vice versa.

Q26. Are the financial risk adjustment procedures you rely on accepted and employed by other regulators?

A26. Yes, a number of regulators in the U.S. and in countries around the world rely upon the ATWACC to set rates and/or apply a version of the Hamada adjustment when analyzing betas. For example, the Surface Transportation Board ("STB") uses the weighted-average cost of capital to determine revenue adequacy for railroads,⁴³ as does the Federal Communication Commission to set rates for local exchange carriers.⁴⁴ The Pennsylvania Public Utility Commission has accepted financial leverage,⁴⁵ and the Florida Public Service Commission uses a very similar method to regulate small water companies.⁴⁶ In a recent decision, the FERC used the weighted-average cost of capital (calculated as I do) as a discount rate in a valuation dispute.⁴⁷ In a recent decision, the Alabama Public Service Commission said:

1		[t]he Commission recognizes that the ATWACC analysis is not a prevalent methodology in the United States; however, the focus of that methodology on the relationship between the market value and the
3		associated financial risk of the utility is compelling."48
4		3. Mr. Lawton Does Not Adequately Adjust for Financial Risk
5	Q27.	Does PHS witness Lawton consider the difference in financial risk between ML&P
6		and the sample?
7	A27.	Yes, Mr. Lawton acknowledges that:
8 9 10		the comparable peer risk group with an average 48.85% equity ratio would be less risky than ML&P with a 35.4% equity ratio. As such the equity return estimates developed from the comparable peer group would reflect lower financial risk and would need to be increased if applied to ML&P
11		for setting rates in this case. ⁴⁹
12		Unlike Mr. Gorman, Mr. Lawton agrees with me that ML&P has more financial risk than
13		the sample. However, as mentioned previously, Mr. Lawton incorrectly measures the
14		financial risk of the sample based on their book value capital structure rather than the
15		market value capital structure.
16	O28.	How does Mr. Lawton adjust his equity return estimates to reflect the increased
17		financial risk of ML&P?
18		
19	A28.	Mr. Lawton notes that theoretical and empirical studies "suggest an increase in common
20		equity costs in a range of 7.6 to 13.8 basis points for every one percent increase in the

debt ratio.⁵⁰ He assumes the low-end 7.6 basis point adjustment and multiplies this by the difference between the sample's average book value equity share (48.85%) and ML&P's regulatory equity share $(35.4\%)^{51}$, resulting in a "102 basis point (13.45 percentage points x 7.6 basis points) equity cost increase for ML&P relative to the comparable group results."⁵²

Q29. Do you agree with Mr. Lawton's methodology to account for the financial risk of ML&P?

A29. No. First, Mr. Lawton understates the financial risk adjustment necessary by comparing ML&P to the book value equity share rather than the market value equity share of the comparable group. Second, he acknowledges a wide range of potential adjustments from 7.6 basis points to 13.8 basis points, yet unconvincingly only applies the low-end adjustment despite the fact that the source cited by Mr. Lawton explicitly states that "more recent studies indicate that the upper end of that range is more indicative of the repercussions on equity costs."⁵³ Thus, using Mr. Lawton's approach the upper bound which shows an increase of 13.8 basis points for each 1% additional leverage should at the very least be considered.

⁵⁰ *Id.*, at 48-49.

⁵¹ Mr. Lawton relied on the equity share as reported in ML&P's Revenue Requirement Study. For clarity, the Company advised the Commission on January 17, 2017, in response to staff questions that the actual consolidated capital structure contains 35.5% equity. Reconciling to this capital structure does not change the calculated weighted cost of capital or the required return in the Revenue Requirement Study nor does it change my ROE recommendations.

Mr. Lawton, like I, estimates the cost of equity using a sample of electric utilities whose average market value equity percentage is substantially higher than 35.5%, so that an adjustment that takes into account the difference between the capital structures relied upon for estimation purposes and the regulatory equity percentage of MLP results in a non-trivial adjustment using Mr. Lawton's source. For example, I calculate the average market value capital structure of Mr. Lawton's sample companies at 56.7% as compared to MLP's equity percentage of 35.5% for a difference of 21.2%. Consequently, an adjustment of 292.0 basis points (calculated as 21.2% multiplied by the "more indicative" 13.8 basis points) is appropriate. This would result in a CAPM ROE of 11.3% to 11.7%.⁵⁴ I note that this range of ROE's are within the range of ROEs I obtained for my CAPM-based models.

It is clear that Mr. Lawton's 100 basis point adjustment to the ROE would not adequately equate ML&P to the average electric utility. This is clearly seen in my direct testimony, Q/A 64, where I show that in the risk premium model, where the difference in the capital structure used to determine the sample's ROE and that of ML&P is *only* 13%, the difference in equity return is 300 basis points; using the upper end of the approach Mr. Lawton cites, the 13% difference would result in an adjustment of 179.4 basis points for a risk premium ROE of 12% (using my 10.2% ROE for the sample).

Q30. Does Mr. Lawton compare ML&P to the average electric utility?

PREFILED REPLY TESTIMONY OF BENTE VILLADSEN Docket No. U-16-094/U-17-008 September 22, 2017 Page 32 of 55

⁵⁴ See Exhibit BV-09 for details.

1	A30.	Yes, Mr. Lawton suggests that his ROE recommendation of 9.5% is reasonable because
2		"cost of equity decisions for electric utility operations for calendar year 2016 averaged
3		about 9.74%" ⁵⁵ and "the average awarded equity return for an electric utility in the U.S.
4		is about 9.8% in 2016."56 Ignoring the slight discrepancy in Mr. Lawton's reported
5		figures, I find that the average allowed ROE for vertically integrated electric utilities
6		from 2016 through September 2017 was approximately 9.7% for a utility with an average
7		regulatory equity ratio of about 48.3%. ⁵⁷
9	031	What would be the implied ROR if ML&P were more like the average electric
10	2011	what would be the implied ROR if willer were more like the average electric
11		utility, as suggested by Mr. Lawton?
12	A31.	Assuming that ML&P had business and financial risks similar to the average electric
13		utility, then a 9.7% ROE would imply an ROR of 6.7%. See Figure 5 below for this
14		illustrative calculation. This assumes the average regulatory capital structure of 48.3%
15		equity, but also includes the embedded cost of debt for ML&P which is much lower than
16		the average electric utility.

None. Mr. Lawton presents no evidence comparing the business risks of ML&P to his 1 A35. 2 electric company sample that would support his conclusion. He discusses the importance 3 of regulatory lag and cost recovery, stating that "[r]ating agencies are foremost concerned 4 with a utility's ability to recover costs and earn an adequate return,"⁶¹ yet he makes no 5 mention of the fact that ML&P has not earned its allowed ROE for many vears.⁶² 6 Furthermore, Mr. Lawton acknowledges that ML&P's significant capital expenditure 7 program is a risk factor: "These plant additions have caused substantial borrowing 8 increases causing the equity ratio to decline and placed a financial risk on the system."63 9 These facts would support my conclusion that ML&P is of higher risk than the average 10 electric company. 11 12 What does Mr. Gorman say about ML&P's business risk? **O36**. 13 Mr. Gorman asserts that "ML&P's relative risk is comparable, if not lower than the risk A36. 14 of the utility companies included in the proxy group."64 15 16 Q37. What evidence does Mr. Gorman provide to support this conclusion? 17 A37. Mr. Gorman shows that ML&P's credit rating from S&P of A+ is higher than the average 18 S&P credit rating of BBB+ for the proxy group.⁶⁵ He believes that the risk factors I 19 present are "already incorporated in the credit ratings of the proxy group companies," so 20 ⁶¹ *Id.*, at 28. 21 ⁶² Tariff Advice Letter 357-121, Exhibit 6 at 83. 22 ⁶³ Lawton Direct Testimony at 14. 23 ⁶⁴ Gorman Direct Testimony, Appendix B at 56. ⁶⁵ Id., Appendix B at 57. 24 25 PREFILED REPLY TESTIMONY OF BENTE VILLADSEN 26 Docket No. U-16-094/U-17-008

1		that the market believes ML&P is less risky than the proxy group given its higher credit
2		rating. ⁶⁶
3	0.29	
4	Q38.	Are credit ratings an appropriate measure of the risk of a company's equity?
5	A38.	No, the goal of the credit rating agencies is not to measure or evaluate the systematic risk
6		of a company's equity, but rather to evaluate the probability that a company will default
7		on its debt. Moody's states this goal concisely in its methodology documents:
8		Ratings assigned on Moody's global long-term and short-term rating
9		financial obligations issued by non-financial corporates, financial institutions attractured finance unbigles, project finance unbigles, and
10		public sector entities. Long-term ratings are assigned to issuers or
11		on the likelihood of a default on contractually promised payments and
12		the expected financial loss suffered in the event of default."
13		Default is a manifestation of the company being unable to make good on its debt
14		obligations. For companies with a high end investment grade rating (including MLP and
15		the sample companies), the probability of default is very low. ⁶⁸
16		While credit ratings speak to the probability of debt-holders being paid a
17		promised amount in a timely fashion, equity risk relates to systematic risk or the tendency
18		of a security's returns to respond to returns in the broader stock market. For this reason, a
19		higher credit rating does not necessarily correspond to lower shareholder risk, or vice

KEMPPEL,

versa. Two companies with identical credit ratings need not have the same required return on equity. For instance, factors that make a company's cash flow more sensitive to the broader market would affect the cost of equity even if they do not affect the individual company's probability of default enough to warrant a change in credit rating.

What do you recommend as ML&P's overall return given its risks? Q39.

A39. I find the arguments of Mr. Lawton and Mr. Gorman unconvincing. I maintain my conclusion that ML&P is riskier than the average electric utility due to its high capital spend, inability to earn its allowed ROE, and smaller than average size and should be allowed a return at the higher end of the range. I recommend an ROE range of 12.5% to 13.5% with a point estimate of 13%. This would suggest an overall ROR of 7.15%, which is conservative and still below the median allowed ROR for vertically integrated electric utilities as shown in Figure 2. Furthermore, I recommend the use of a consolidated capital structure for ML&P of 35.5% equity / 64.5% debt. As stated in my direct testimony, I find the use of a consolidated capital structure reasonable as investors in ML&P do not distinguish between the utility's electric and gas operations, it would simplify the ratemaking procedure, and there would be little cross-subsidization since the customers of the Electric and Gas Funds overlap.⁶⁹

What capital structure did other witnesses use? **O40**.

25

23

24

PREFILED REPLY TESTIMONY OF BENTE VILLADSEN Docket No. U-16-094/U-17-008 September 22, 2017 Page 38 of 55

⁶⁹ Villadsen Direct Testimony at 13-14. I have updated the capital structure to be consistent with the Company's Equity Management Plan and the Company's response to Commission staff's questions on January 17, 2017. This slight update to the capital structure has no impact on my recommendation of the range of reasonableness for the ROE.

Mr. Lawton⁷⁰ and Mr. Gorman⁷¹ both refer to the capital structure used by ML&P from A40. 1 2 Schedule 3 of the Revenue Requirement Study which represented the consolidated 3 electric fund and gas fund operations of the Company. Thus, there is no dispute about 4 the use of a consolidated capital structure. 5 How does the use of a consolidated capital structure affect your recommended ROE **Q41**. 6 for the Company? 7 8 The fact that ML&P owns a gas business does not substantially affect the overall cost of A41. 9 capital of the Company. In determining the appropriate ROE for ML&P, I recommend a 10 range from 12.5% to 13.5%, with a midpoint of 13%, for the consolidated entity.⁷² The 11 consolidated business risk would be an average of the business risk of each fund in 12 ML&P weighted by the size of that fund. It is clear that the gas fund, comprising only 13 approximately \$11.6 million of equity,⁷³ is small in comparison to the total \$246 million 14 equity portion of ML&P's requested rate base.⁷⁴ The equity in the BRU is therefore only 15 approximately 4.7% of ML&P's total equity, meaning that its minimal effect on the 16 overall cost of capital for ML&P is well below what can be reliably measured. 17 For example, suppose that the gas fund represented separate risks to equity 18 19 than the electric fund such that the fair and reasonable ROE for the Gas Fund were either 20 ⁷⁰ Lawton Direct Testimony at 3. 21 ⁷¹ Mr. Gorman's Workpapers to Exhibit MPG-3, tab "ROR Revenue Workpaper". 72 Villadsen Direct Testimony at 5. 22 73 Request for Approval of Ratemaking and Accounting Treatment for ML&P's Interest in the 23 Beluga River Unit, Docket U-16-060, dated June 20, 2016, at 11. ⁷⁴ 35.5% equity share x 694 million rate base.

RESPONSIVE TESTIMONY TO FEA WITNESS GORMAN

Q42. What other issues do you have with Mr. Gorman's testimony?

A42. In addition to the issues presented above related to ML&P's business and financial risks, I have a few other issues with Mr. Gorman's testimony. First, Mr. Gorman recommends a return for ML&P that is unreasonably low in comparison to the allowed returns for other electric utilities. Second, Mr. Gorman suggests that the use of adjusted betas in my Empirical CAPM ("ECAPM") estimate is inappropriate and double counts the adjustments necessary. On this point, he is incorrect and does not understand that the adjustments are fundamentally different and complementary. Finally, Mr. Gorman's testimony in this proceeding is inconsistent with his statements in recent testimony from other jurisdictions.

A. <u>Gorman's Primary Recommendation Implies An Unreasonably Low Rate of</u> <u>Return</u>

Q43. How has Mr. Gorman determined his primary recommendation?

A43. Mr. Gorman states that his "recommended revenue increase is not based on a rate of return on rate base methodology" and instead uses a debt service coverage ("DSC")

⁷⁵ $1\% \times 4.7\%$. If applied to BRU's capitalization, the magnitude is about \$5,400.

25

PREFILED REPLY TESTIMONY OF BENTE VILLADSEN Docket No. U-16-094/U-17-008 September 22, 2017 Page 40 of 55 methodology.⁷⁶ Therefore, Mr. Gorman estimates the amount of revenue ML&P should be allowed to recover in order to produce what he believes to be appropriate levels of cash flow to cover the company's debt service obligations. To do this, Mr. Gorman removes the Rate Stabilization Adjustments ("RSA") proposed by the Company and then decreases ML&P's revenue requirement to a level that results in projected financial metrics he finds reasonable.⁷⁷ Mr. Gorman does not propose adjustments to the cost of service; he does not propose specific line item adjustments to the Company's revenue requirement study; he simply backs in to this figure of a \$19 million reduction to ML&P's proposed revenue that he finds reasonable without any evidence that ML&P's cost of service or revenue requirement study are incorrect.⁷⁸ This clearly diverges from the approaches taken by myself and Mr. Lawton and the Commission should place no weight on Mr. Gorman's testimony. The rate of return regulation requires a return on equity commensurate with what equity investors require on investments of similar risk. In this case the best comparables are integrated electric utilities.

Q44. How would the implied return for ML&P from Mr. Gorman's primary recommendation compare to the return allowed for other electric utilities?

A44. Mr. Gorman's primary recommendation would imply an overall ROR and an ROE far below any recently allowed return for an electric utility. As shown in Figure 7 below, Mr. Gorman's primary recommendation would reduce the return for ML&P by

⁷⁷ See Gorman Direct Testimony, Exhibit MPG-2.

	1	A46.	No. In response to discovery requests, Mr. Gorman states that his proposed revenue
	2		reduction of \$19 million would imply an ROR of 5.27% and an ROE of 7.71%. ⁸³
L CORPORTION LANE, SUITE 200 ZAA 99503-2025 Z7-1604	3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19	Q47. A47.	Do you agree with Mr. Gorman's statement of his implied ROR and ROE? No. My calculations in Figure 7 and Figure 8 accurately portray the implied ROR and ROE from Mr. Gorman's primary recommendation that should be compared to my recommendation, the recommendation of Mr. Lawton, and the recently authorized RORs and ROEs for other electric utilities. Mr. Gorman's response in Exhibit BV-06 is based on his forecasted ROR for ML&P, as shown in his Workpapers to Exhibit MPG-2, rather than the Revenue Requirement Study produced by ML&P. ⁸⁴ In fact, Mr. Gorman's financial forecast of his primary recommendation shows the ROR for ML&P declining from 5.27% in 2017 to 4.22% in 2021. At the same time, the ROE for ML&P would decline from 6.78% in 2017 to 3.11% in 2021. ⁸⁵ I summarize these results from Mr. Gorman's analysis in Figure 9 below.
ESSIONA REWEED GE, AL/ (907) 2	20	⁸³ Evi	nibit RV 06 at 3.5

KEMPPEL, HUFFMAN AND ELLIS

1	Figure 9
2	Financial Forecast from Mr. Gorman's Primary Recommendation
3	2017 2018 2019 2020 2021
4	MPG-2, Tab "Electric"
5	[a] Gorman Recommended ROE 6.78% 4.93% 4.32% 3.46% 3.11%
6	[b] Gorman Recommended ROR 5.27% 4.95% 4.66% 4.45% 4.22%
7	Sources: [a]: Workpaper MPG-2, tab 'Electric' at row 574.
8	[b]: Workpaper MPG-2, tab 'Electric' at row 577.
9	I have two specific findings based on Mr. Gorman's response in Exhibit BV-06. First, it
10	is unreasonable and defies all logic to recommend an ROE that would be less than the
11	overall ROR. This would suggest that equity is less risky than debt, a premise that is not
12	supported in any financial literature. Second any analysis of the implied ROR and ROF
13	for MI &P based on Mr. Gorman's primary recommendation lead to numbers that are far
14	for whether based on wir. Gorman's primary recommendation lead to numbers that are far
15	below the range of reasonableness. Ignoring his inconsistency of presenting an ROE of
16	7.71% for ML&P in Exhibit BV-06 and presenting an ROE of 6.8% in Exhibit MPG-2 to
17	his prefiled testimony, even Mr. Gorman's suggestion of 7.71% as the implied ROE from
18	his primary recommendation would be rejected as unreasonable by Mr. Lawton (who sets
19	a minimum threshold of 7.75% in his analysis) and by Mr. Gorman's standards in prior
20	testimony (that any ROE below 8% would cause him concern).
21	Lastly I note that it appears Mr. Gorman calculates the ROE for this year

as the Net Income for this year divided by the Total Fund Equity for last year. A more conventional approach would calculate this year's ROE as this year's Net Income divided by the average Total Fund Equity for the year; e.g., the average of the equity outstanding PREFILED REPLY TESTIMONY OF BENTE VILLADSEN Docket No. U-16-094/U-17-008

September 22, 2017 Page 45 of 55

at the end of last year and this year. Calculating the ROE as the current year's net income divided by the average of the equity results gives an ROE of 6.56% rather than 6.78% for 2017.

Mr. Gorman's primary recommendation diverges from rate base / rate of return methodology, proposes an overall ROR that is below any recently allowed ROR for electric utilities, and would apply an ROE for ML&P that is far below the range of reasonableness. For all of these reasons, the Commission must reject Mr. Gorman's primary recommendation.

B. Empirical CAPM As Implemented is Meaningful

Q48. How do you respond to Mr. Gorman's assertions that employing the ECAPM while using adjusted beta estimates from *Value Line* is inappropriate?⁸⁶

A48. Mr. Gorman is not correct. These are two fundamentally different and complementary adjustments. This can be shown by reference to Figure 10 below which illustrates the empirical security market line ("SML"). The adjustment to beta corrects the estimate of the relative risk of the company, which is measured along the horizontal axis of the SML. The ECAPM adjusts the risk-return tradeoff (i.e., the slope) in the SML, which is on the vertical axis. In other words, the expected return (measured on the vertical axis) for a given level of risk (measured on the horizontal axis) is different from the predictions of the theoretical CAPM. Getting the relative risk of the investment correct does not adjust

⁸⁶ Gorman Direct Testimony, Appendix B at 47-50.

apply a consistent adjustment procedure to historical betas that increased their accuracy in *forecasting* eventual realized betas. Essentially, Professor Blume's adjustment transforms a historical beta into a better estimate of expected future beta. It is this expected "true" beta that drives investors' expected returns according to the CAPM. Therefore, it is appropriate to use *Value Line's* adjusted betas, rather than raw historical betas, when employing the CAPM to estimate the forward-looking cost of equity capital.

However, the backward-looking empirical tests of the CAPM that gave rise to the ECAPM did not suffer from bias in the measurement of betas. Researchers plotted realized stock portfolio returns against betas measured *over the same time period* to produce plots such as Figure 11 below, which comes from the 2004 paper by Professors Eugene Fama and Kenneth French.⁸⁸ The fact that betas and returns were measured contemporaneously means that the betas used in the tests were *already the best possible measure* of the "true" systematic risk over the relevant time period. In other words, no adjustments were needed for these betas. Despite this, researchers observed that the risk-return trade-off predicted by the CAPM was too steep to accurately explain the realized returns. As explained above the ECAPM explicitly corrects for this empirical observation.

apply the ECAPM to adjust for the empirical shortcomings of the CAPM. Q52. Can you summarize the independent reasons for using adjusted betas and employing the ECAPM? Raw historical betas are adjusted to provide a better estimate of *expected* "true" betas, A52. which are the appropriate measure of risk that predicts expected future returns in the CAPM. The ECAPM is used because empirical tests show that even when the best possible estimate of "true" beta is used, the CAPM tends to under-predict required returns for low-beta stocks and over-predict required returns for high-beta stocks. These are independent but complementary adjustments supported by empirical tests of this model of financial theory. Both adjustments are appropriate when using risk-positioning models to estimate the cost of equity.

Do any other cost of capital witnesses in this proceeding support using adjusted Q53. betas when employing the ECAPM?

Yes, Mr. Lawton's ECAPM analysis presented in Exhibit DJL-9 also uses adjusted betas A53. from Value Line.

VI. <u>RESPONSIVE TESTIMONY TO PHS WITNESS LAWTON</u>

Q54. What other issues do you have with Mr. Lawton's testimony?

A54. In addition to the issues presented above related to ML&P's business and financial risks, I also have issue with Mr. Lawton's use of a historical interest rate as the risk-free rate input for his CAPM analysis.⁹⁰

Q55. What Treasury yield does Mr. Lawton rely on to estimate the risk-free rate?

A55. He adopts as his risk-free rate input 2.90%, which he states is the recent three-month average on 30-year U.S. Treasury bonds from April through June 2017.⁹¹ In doing so, he rejects forecasted bond yields such as those relied on by Mr. Gorman⁹² and myself, stating that this historical average is "the best approximation of interest rate levels," and asserting that the market expects low yields on interest rates "for the foreseeable near term future."⁹³

Q56. Do you agree with Mr. Lawton that historical bond yields are the best approximation of future levels and that forecasted bond yields are not valuable in estimating future interest rates?

A56. No. While it is certainly true that expert forecasts do not always precisely predict eventual spot yields, research shows that such forecasts generally exhibit a conservative

⁹¹ *Ibid*.

⁹² Gorman Direct Testimony, Appendix B at 26.

⁹³ Lawton Direct Testimony at 21-22.

25

26

⁹⁰ Lawton Direct Testimony at 40.

"status quo bias"—tending to over-predict eventual spot yields during falling interest rate environments and *under*-predict actual yields when interest rates are on the rise.⁹⁴ Since interest rates have generally followed a downward trajectory since the financial crisis, it is then not surprising that the forecasts have tended to predict higher yields than were eventually realized. However, when interest rates do rise, they may well do so more dramatically or at a faster pace than anticipated by market participants.

Additionally, the futures traded on interest rates indicate that the market expects the rates to increase. See Figure 13 below. While these Eurodollar futures traded are traded on short-term interest rates and not the long-term rates relied upon in Mr. Lawton's (or my) CAPM they do imply the market are expected yields to increase.⁹⁵ In interpreting Figure 13 below, it is important to recognize that the level of interest rates depicted have no bearing on the long-term risk-free rate used in the CAPM or risk premium model.

⁹⁴ R.W. Hafer and Scott Hein, "Comparing Futures and Survey Forecasts of Near-Term Treasury Bill Rates," *Federal Reserve Bank of St. Louis*, May/June 1989.

⁹⁵ Because the yield curve changes over time, the long-term interest rate may increase faster or slower than the short-term interest rates.

Finally, it is not reasonable to completely ignore forecasts and suggest that they do not reflect market forces, particularly when traded futures suggest that the market expects treasury bond yields to rise as shown above. The financial institutions and economic experts that contribute projections to publications such as Blue Chip are both observers of and participants in financial markets. Their opinions are both informed by and exert influence over market forces in determining asset prices (including for government bonds).

Q57. How would Mr. Lawton's CAPM and ECAPM estimates differ if he relied on a risk-free rate estimate in line with those employed by you and Mr. Gorman?

A57. If Mr. Lawton had relied on Mr. Gorman's risk-free rate input of 3.70% rather than his historical input of 2.90%, his CAPM and ECAPM results would have been higher by PREFILED REPLY TESTIMONY OF BENTE VILLADSEN Docket No. U-16-094/U-17-008

12)					
13	THE FEDERAL EXECUTIVE AGENCIES' ("FEA") RESPONSES TO MUNICIPAL LIGHT & POWER'S					
14	THIRD SET OF DISCOVERY REQUESTS (MLP-FEA-3)					
15	A. <u>Prefiled Testimony of Michael P. Gorman.</u>					
16	<u>MLP-FEA-3-1</u> : Regarding the workpapers to Exhibit MPG-2 produced in					
17	response to MLP-FEA-1-2:					
19	(a) Please explain how Mr. Gorman determined the "Gorman Proposed					
20	Revenue Reduction" figure set to \$19 million in cell AA3 on tab "Electric."					
21	(b) Which specific items in ML&P's revenue requirement, as presented in					
22	TA357-121 Exhibit 7 at 2, does Mr. Gorman propose decreasing in order to reach the					
23	\$19 million "Gorman Proposed Revenue Reduction"?					
24	(c) Would the "Gorman Proposed Revenue Reduction" be a permanent					
25	reduction to ML&P's total revenue requirement?					
26						
	August 18, 2017 Page 1 of 5 Exhibit BV-06 Page 1 of 5					

Response:

(a) The revenue reduction of \$19 million was made to the Company's total proposed revenue increase of \$39.48 million to arrive at Mr. Gorman's proposed increase of \$20.48 million. The ML&P spreadsheet provided to measure the financial metrics included ML&P's proposed revenue adjustment for the RSA of \$12.875 million. Mr. Gorman reversed ML&P's RSA revenue adjustment and substituted his proposed revenue adjustment to measure the resulting revised projected financial metrics.

(b) Mr. Gorman proposed a revenue requirement that produces financial
metrics outlined by ML&P's EMP. Mr. Gorman did not propose adjustments to the cost of
service, but rather proposed a more accurate revenue requirement that is necessary to recover
ML&P's requested cost of service, and support its target debt service coverage requirements,
unrestricted cash balances, equity buildup, and other metrics included in ML&P's EMP program.
In effect, this is a more accurate revenue requirement needed in order to accomplish the EMP
financial planning objectives.

(c) Mr. Gorman's proposed revenue level will remain in effect until the
 Company can demonstrate that the revenues produced under approved rates are not adequate to
 meet the financial metric targets outlined in its EMP.

Person(s) Supplying Information: Michael P. Gorman
